couseful for screening a candidate agent for its biological effect. (I) is compositions that modulate the expression or function of its encoded compositions that modulate the expression or function of its encoded compositions that modulate the expression or function of its encoded compositions that modulate the expression or function of its encoded compositions that modulate the expression or function of its encoded compositions that the commanication of cells, particularly plant cells. (I) is also useful for the genetic commanication of cells, particularly plant cells. (I) is also useful in the screening assays of various plant strains to determine the strains that commanication in the strain strains. (I) is also useful in screening assays of various plant strains to determine the strains that capable of withstanding a particular disease or environmental stress. (II) and (III) are useful for screening of biologically active agents, e.g., fungicides, etc., for elucidating biochemical pathways. The screened agents are useful in improved methods of treating crops to programs to identify agents that mimic or enhance the action of tolerance compositions. (III) is useful for identifying other mediators that may induce expression of proteins of interest, for establishing the extent to which any specific insect and/or pathogen is responsible for damage to a particular plant, for identifying other mediators that enhance or induce tolerance to environmental stress, for identifying factors involved in biosynthetic pathways of nutritional, commercial, or medicinal value and composition of the study of genetic function and regulation, composition of the sequence data for this patent did not form art of the printed specification, but was obtained in electronic format directly from USPTO at segdata.uspto.gov/sequence.html?DocID=99909770445.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an Arabidopsis thaliana nucleic acid (I) comprising a sequence capable of hybridising under stringent conditions to a sequence selected from any one of plant (BN98233-ABN99231), given in the specification or its fragment. A polypeptide (II) encoded by (I), a transgenic plant (III) comprising an exogenous nucleic acid or a genetically modified cell (IV) comprising an exogenous nucleic acid, is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New Arabidopsis thaliana nucleic acid for identifying homologous genes, producing compositions that modulate the expression or function of its encoded protein, and mapping functional regions of protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (KRIC/)

Patent No. US20020142382A1

GENERAL INFORMATION:

APPLICANT: MERRULOV, Gennady et al.

TITLE OF INVENTION: ISOLATED HUMAN RAS-LIKE PROTEINS,

TITLE OF INVENTION: NUCLEIC ACID MOLECULES ENCODING THE

TITLE OF INVENTION: PROTEINS, AND USES THEREOF

FILE REFERENCE: CL001196

CURRENT APPLICATION NUMBER: US/09/820,003A

CURRENT FILING DATE: 2001-03-29

NUMBER OF SEQ ID NOS: 39

SOFTWARE: FASTSEQ for Windows Version 4.0
